#### § 23.235

decreased to at least 50 percent of the speed at touchdown.

- (c) The airplane must have adequate directional control during taxiing.
- (d) Seaplanes must demonstrate satisfactory directional stability and control for water operations up to the maximum wind velocity specified in paragraph (a) of this section.

[Doc. No. 4080, 29 FR 17955, Dec. 18, 1964, as amended by Amdt. 23–45, 58 FR 42159, Aug. 6, 1993; Amdt. 23–50, 61 FR 5192, Feb. 9, 1996]

# § 23.235 Operation on unpaved surfaces.

The airplane must be demonstrated to have satisfactory characteristics and the shock-absorbing mechanism must not damage the structure of the airplane when the airplane is taxied on the roughest ground that may reasonably be expected in normal operation and when takeoffs and landings are performed on unpaved runways having the roughest surface that may reasonably be expected in normal operation.

[Doc. No. 27807, 61 FR 5192, Feb. 9, 1996]

## §23.237 Operation on water.

A wave height, demonstrated to be safe for operation, and any necessary water handling procedures for seaplanes and amphibians must be established.

[Doc. No. 27807, 61 FR 5192, Feb. 9, 1996]

## §23.239 Spray characteristics.

Spray may not dangerously obscure the vision of the pilots or damage the propellers or other parts of a seaplane or amphibian at any time during taxiing, takeoff, and landing.

MISCELLANEOUS FLIGHT REQUIREMENTS

# $\S 23.251$ Vibration and buffeting.

(a) There must be no vibration or buffeting severe enough to result in structural damage, and each part of the airplane must be free from excessive vibration, under any appropriate speed and power conditions up to  $V_D/M_D$ , or  $V_{DF}/M_{DF}$  for turbojets. In addition, there must be no buffeting in any normal flight condition, including configuration changes during cruise, severe enough to interfere with the satisfactory control of the airplane or cause

excessive fatigue to the flight crew. Stall warning buffeting within these limits is allowable.

- (b) There must be no perceptible buffeting condition in the cruise configuration in straight flight at any speed up to  $V_{\rm MO}/M_{\rm MO},$  except stall buffeting, which is allowable.
- (c) For airplanes with M<sub>D</sub> greater than M 0.6 or a maximum operating altitude greater than 25,000 feet, the positive maneuvering load factors at which the onset of perceptible buffeting occurs must be determined with the airplane in the cruise configuration for the ranges of airspeed or Mach number. weight, and altitude for which the airplane is to be certificated. The envelopes of load factor, speed, altitude, and weight must provide a sufficient range of speeds and load factors for normal operations. Probable inadvertent excursions beyond the boundaries of the buffet onset envelopes may not result in unsafe conditions.

 $[Amdt.\ 23\text{--}62,\ 76\ FR\ 75755,\ Dec.\ 2,\ 2011]$ 

### § 23.253 High speed characteristics.

If a maximum operating speed  $V_{MO}/M_{MO}$  is established under  $\S23.1505(c)$ , the following speed increase and recovery characteristics must be met:

- (a) Operating conditions and characteristics likely to cause inadvertent speed increases (including upsets in pitch and roll) must be simulated with the airplane trimmed at any likely speed up to  $V_{MO}/M_{MO}$ . These conditions and characteristics include gust upsets, inadvertent control movements, low stick force gradients in relation to control friction, passenger movement, leveling off from climb, and descent from Mach to airspeed limit altitude.
- (b) Allowing for pilot reaction time after occurrence of the effective inherent or artificial speed warning specified in §23.1303, it must be shown that the airplane can be recovered to a normal attitude and its speed reduced to  $V_{\text{MO}}/M_{\text{MO}},$  without—
- (1) Exceptional piloting strength or skill:
- (2) Exceeding  $V_{\rm D}/M_{\rm D},$  or  $V_{\rm DF}/M_{\rm DF}$  for turbojets, the maximum speed shown under §23.251, or the structural limitations; and

- (3) Buffeting that would impair the pilot's ability to read the instruments or to control the airplane for recovery.
- (c) There may be no control reversal about any axis at any speed up to the maximum speed shown under §23.251. Any reversal of elevator control force or tendency of the airplane to pitch, roll, or yaw must be mild and readily controllable, using normal piloting techniques.
- (d) Maximum speed for stability characteristics,  $V_{FC}/M_{FC}$ .  $V_{FC}/M_{FC}$  may not be less than a speed midway between  $V_{MO}/M_{MO}$  and  $V_{DF}/M_{DF}$  except that, for altitudes where Mach number is the limiting factor,  $M_{FC}$  need not exceed the Mach number at which effective speed warning occurs.

[Amdt. 23–7, 34 FR 13087, Aug. 13, 1969; as amended by Amdt. 23–26, 45 FR 60170, Sept. 11, 1980; Amdt. 23–45, 58 FR 42160, Aug. 6, 1993; Amdt. 23–50, 61 FR 5192, Feb. 9, 1996; Amdt. 23–62, 76 FR 75755, Dec. 2, 2011]

## $\S 23.255$ Out of trim characteristics.

For airplanes with an  $M_D$  greater than M 0.6 and that incorporate a trimmable horizontal stabilizer, the following requirements for out-of-trim characteristics apply:

- (a) From an initial condition with the airplane trimmed at cruise speeds up to  $V_{MO}/M_{MO}$ , the airplane must have satisfactory maneuvering stability and controllability with the degree of out-of-trim in both the airplane nose-up and nose-down directions, which results from the greater of the following:
- (1) A three-second movement of the longitudinal trim system at its normal rate for the particular flight condition with no aerodynamic load (or an equivalent degree of trim for airplanes that do not have a power-operated trim system), except as limited by stops in the trim system, including those required by §23.655(b) for adjustable stabilizers; or
- (2) The maximum mistrim that can be sustained by the autopilot while maintaining level flight in the high speed cruising condition.
- (b) In the out-of-trim condition specified in paragraph (a) of this section, when the normal acceleration is varied from +1 g to the positive and negative values specified in paragraph (c) of this section, the following apply:

- (1) The stick force versus g curve must have a positive slope at any speed up to and including  $V_{FC}/M_{FC}$ ; and
- (2) At speeds between  $V_{FC}/M_{FC}$  and  $V_{DF}/M_{DF}$ , the direction of the primary longitudinal control force may not reverse.
- (c) Except as provided in paragraphs (d) and (e) of this section, compliance with the provisions of paragraph (a) of this section must be demonstrated in flight over the acceleration range as follows:
  - (1) -1 g to +2.5 g; or
- (2) 0 g to 2.0 g, and extrapolating by an acceptable method to -1 g and +2.5
- (d) If the procedure set forth in paragraph (c)(2) of this section is used to demonstrate compliance and marginal conditions exist during flight test with regard to reversal of primary longitudinal control force, flight tests must be accomplished from the normal acceleration at which a marginal condition is found to exist to the applicable limit specified in paragraph (b)(1) of this section.
- (e) During flight tests required by paragraph (a) of this section, the limit maneuvering load factors, prescribed in §§ 23.333(b) and 23.337, need not be exceeded. In addition, the entry speeds for flight test demonstrations at normal acceleration values less than 1 g must be limited to the extent necessary to accomplish a recovery without exceeding  $V_{\rm DF}/M_{\rm DF}$ .
- (f) In the out-of-trim condition specified in paragraph (a) of this section, it must be possible from an overspeed condition at  $V_{\text{DF}}/M_{\text{DF}}$  to produce at least 1.5 g for recovery by applying not more than 125 pounds of longitudinal control force using either the primary longitudinal control alone or the primary longitudinal control and the longitudinal trim system. If the longitudinal trim is used to assist in producing the required load factor, it must be shown at  $V_{DF}/M_{DF}$  that the longitudinal trim can be actuated in the airplane nose-up direction with the primary surface loaded to correspond to the least of the following airplane nose-up control forces:
- (1) The maximum control forces expected in service, as specified in §§ 23.301 and 23.397.
